

## Assignment 1 – Two Truths and a Lie

### Learning Objective

---

Write a Python program that creates and uses variables of different types.

### Assignment Description

---

Create variables with information about yourself. Use the `print()` function to print information to the user.

### Steps

---

1. In PyCharm (Community Edition), open an existing project (such as ITP115) or create a new project.
  - If you open an existing project, then create a new directory (probably under the Assignments directory) named **a1\_last\_first** where *last* is your last/family name and *first* is your preferred first name. Use all lowercase letters.
  - If you create a new project, then name it **a1\_last\_first** where *last* is your last/family name and *first* is your preferred first name. Use all lowercase letters.
2. In the project or directory, create a new Python file called **assignment1.py**. At the top of the file, put comments in the following format and replace the name, email, and section with your actual information:

```
# Name, USC email
# ITP 115, Spring 2022
# Section: number or nickname
# Assignment 1
# Description:
# Describe what this program does such as:
# This program displays two truths and a lie.
```

3. Create the following variables with information about yourself:
  - 5 strings (**str**): first, last, statement1, statement2, statement3
  - 3 Booleans (**bool**): truth1, truth2, truth3
  - 2 integers (**int**): pets, siblings

4. The variable named **first** should hold your preferred first name while the variable named **last** should hold your last/family name.
5. The **statement1**, **statement2**, and **statement3** variables should be three statements about you such that two of them are true and one of them is a lie.
6. The **truth1**, **truth2**, and **truth3** variables should be set to **True** or **False** depending on if the corresponding statement is a truth or a lie. Two of them should be set to **True** and one them should be set to **False**.
7. The variable named **pets** should be an integer representing the number of pets you have.
8. The variable named **siblings** should be an integer representing the number of sibling you have.
9. Print your full name on one line using one print statement and the two appropriate variables.
10. Print the number of pets and siblings using the appropriate integer variables.
11. Print the three statements using the appropriate string variables.
12. Print messages saying if each statement is true by using the appropriate Boolean variables.
13. Be sure to comment your code. This means that there should be comments throughout your code. Generally, a comment for every section of code explaining what it does. Points will be deducted for not having comments.
14. Test the program. Look at the Sample Output below. Assignments that do not run are subject to 20% penalty.
15. Prepare your submission:
  - Find the **a1\_last\_first** folder on your computer and compress it. This cannot be done within PyCharm.
  - On Windows, use **File Explorer** to select the folder. Right click and select the Send to -> Compressed (zipped) folder option. This will create a zip file.
  - On Mac OS, use **Finder** to select the folder. Right click and select the Compress "*FolderName*" option. This will create a zip file.
16. Upload the zip file to your Blackboard section:
  - On Blackboard, navigate to the appropriate item.

- Click on the specific item for this assignment.
- Click on the **Browse Local Files** button and select the zip file.
- Click the **Submit** button.

## Grading

- This assignment is worth 20 points.
- Make sure that you the program runs. Points will be taken off if the graders have to edit the source code to test your program.
- Make sure to submit your assignment correctly as described above. Points will be taken off for improper submission.

Item	Points
Creating 5 str variables	5
Create 3 bool variables	3
Create 2 int variables	2
Print using variables	5
Comments, followed instructions, and proper submission	5
<b>Total</b>	<b>20</b>

## Sample Output

**Full name: Trina Gregory**

**Number of pets: 2**

**Number of siblings: 1**

**Statement 1: I have lived in a country outside of the US.**

**Statement 2: I can juggle.**

**Statement 3: I have ice skated at Rockefeller Center in NYC.**

**Statement 1 is False**

**Statement 2 is True**

**Statement 3 is True**
